Digital Literacy Project Report

Name: Rudra S. Solav

Reg no: 25BAI10373

Course: BTech

Branch: CSE[AI&ML]

Year: 2025-2029

Course Code: CSE0001

Date:28/03/2026

Introduction

This project was designed by me to improve digital literacy through practical online tasks.

It focused on using digital tools for communication, collaboration, presentation, coding practice, and online safety. The repository shows work completed across multiple task folders, including a presentation file, a portfolio folder, coding and collaboration platforms, email etiquette tasks, and a cybercrime awareness section. A Google Form link is also included in the repository README for Task 3.

The project also helped me understand the importance of cyber safety and careful online behaviour. Overall, it gave me hands-on experience with tools that are useful both in college and in future professional work.

Task 1 Write-up

In Task 1, I created a presentation on digital literacy using Canvas and saved it as a PDF in the repository. In 6 slides that I have made, I had to decide what information I have to include, what design, what font, which colour like everything that make me to learn how to make a good ppt.

In this ppt, first slide gives info about topic of ppt that is ‘Digital Literacy’.

Slide 2 tells about what Digital Literacy is, it’s definition and about it.

Slide 3 is about ‘Why Digital Literacy Matters’, it tells about it’s objective.

Slide 4 is based on list of useful Digital tools for students, it’s important because these are the tools use while this project.

Slide 5 is most important it is about ‘Safe Internet Practices.’

Slide 6 is last and Thank you slide.

This Task 1 makes me understand how a good ppt is made. This task also improved my confidence in using a design platform for academic work. It showed me that visual communication is useful when explaining topics such as online safety, digital tools, and responsible internet use. The final presentation became an important part of my project because it introduced the main theme of digital literacy in a clear and structured way.

The think I was most interested in this Task 1 was choosing the best design for ppt.

Task 2 Write-up

In Task 2, First, I updated my profile on GitHub and uploaded profile screenshots into the repository. The folder structure in the repo shows a separate Task-2-portfolio/ section, which helped keep the work organized.

In this profile only, I am creating my repository containing my Digital Literacy Project.

Then, I created my profile on Linkedln after learning that it is the most essential component of Digital Portfolio.

At last, I created my profile on Kaggle which is a great platform for learning data science.

In next four years, I planned to connect with great alumni ,industrialists , recruiters based on my achievements and activities through Linkedln.

I also planned to upload my interesting projects on Github that even others would find interesting, easy to understand and help others also to learn.

I planned to master Data Science through Kaggle platform also.

Task 3 Write-up

In Task 3, I explored coding and collaboration platforms. The repository contains a Task-3-platforms/ folder, and the README includes a Google Form link for the task.

For the coding part, I practiced solving a beginner-level python problem on hackerrank, which helped me understand basic logic and input-output handling. For the collaboration part, I created a Google Form with questions related to digital literacy and linked it in the project README. This task showed me how coding platforms and Google Workspace tools support learning in different ways. It also helped me understand how forms and spreadsheets can be used for collecting and reviewing information.

Task 4 Write-up

One situation where poor digital communication caused a problem is when a student emailed a professor asking for help but uses an unclear subject line and informal language. The email did not mention the course name, assignment details, or specific question. Because of this, the professor did not understand the request and ignored the email, assuming it was not important.

As a result, the student did not receive help on time and performed poorly in the assignment. This problem could have been avoided by writing a clear and professional email with a proper subject line, respectful tone, and complete details.

Using good email etiquette, such as clearly stating the purpose, providing necessary information, mentioning subject clearly helps

avoid misunderstandings and ensures effective communication.

Task 5 Write-up

Most cybercrimes do not happen because of weak technology, but because of human trust and lack of awareness.

While researching on the topic, I got most shocked by the finding some facts about UPI and Financial Frauds like:

- Most UPI frauds happen because users share OTP or PIN themselves - not hacking.
- India loses more than1000 crore rupees due to cyber fraud.
- Fraudsters often claim to be bank officials or customer care-this is called social engineering.

Thus I decided to:

- Not click on unknown links in SMS, email, WhatsApp, or Instagram messages.

- Check the sender carefully before sharing any personal or account information.
- Keep your phone, apps, and browser updated regularly.
- Avoid logging into important accounts on public Wi-Fi.

Conclusion

Overall, this project helped me build useful digital skills and better understand safe and responsible online behaviour. The repository shows that I completed work across presentations, portfolios, coding practice, forms, communication, and cybercrime awareness.
I learned how to organize files in GitHub, use online tools for collaboration, and write more professionally. The project also made me more aware of cyber safety and the importance of checking information before clicking, sharing, or paying online. It was a practical and valuable learning experience that connected classroom learning with real digital tools.
